

# 10 Gigabit fiber optic multimode transmission distance is short

## Overview

As a general guideline, the reach of 10G over OM4 multimode fiber is typically specified as follows: Short Reach (SR) Transceivers (e., 10GBASE-SR): Up to 300 meters (approximately 984 feet)., 10GBASE-LR): Up to 400 meters (approximately 1312. The distance that a 10 Gigabit Ethernet (10G) signal can travel over OM4 (Optical Multimode 4) fiber optic cable depends on various factors, including the specific transceivers used, the quality of the fiber optic cable, and the network architecture. OM4 is a type of multimode optical fiber with. SR Cisco SFP+ modules are widely used to enable 10GbE short-range optical connectivity over multimode fiber in data center networks. Based on the 10GBASE-SR standard, these modules operate at 850nm and are optimized for high-bandwidth links between servers, switches, and storage systems within the. Dispersion limits fiber optic transmission distance by causing signal distortion and is classified into chromatic dispersion, modal dispersion, and polarization mode dispersion (PMD). It is designed for use in high-speed network applications and is typically used in data centers, enterprise networks, and other short distance applications.
