

Cuba DFB Distributed Feedback Laser LPO

Overview

Offers high-quality DFB lasers (1018-1188 nm) for diverse applications. Our lasers support a wide range of operations from picosecond (15, 20 or 50 ps) to nanosecond pulses and CW, ideal for material processing, gas sensing, LiDAR, and semiconductor inspection. A distributed-feedback laser (DFB) is a type of laser diode, quantum-cascade laser or optical-fiber laser where the active region of the device contains a periodically structured element or diffraction grating. This grating acts as a diffraction element that selectively reinforces a specific wavelength, resulting in. Distributed feedback (DFB) lasers employ a periodic grating within or adjacent to the gain medium to enforce single-mode emission and suppress competing resonances. Their key features relative to other semiconductor lasers are their single longitudinal mode (single frequency) emission profile, their high stability and their wavelength tunability.
