Does a patch panel affect the network

Overview

Does a patch panel affect network performance?

No — a correctly specified and installed patch panel is a passive component and introduces no measurable performance degradation. A patch panel is one of those components that is easy to overlook when planning a network — it does not switch, route, or process data, and to the uninitiated it can look like an expensive way to add an extra set of connectors between the cable and the switch. They come in a range of sizes, and are typically mountable, whether that's on a wall, or on a rack to make for easier. A patch panel, including fiber patch panels and Ethernet patch panels, is a passive network device that centralizes, terminates, and organizes multiple copper or fiber cables. Confusing their functions can lead to disorganized cabling, frustrating troubleshooting, and inefficient data flow. According to Grand View Research, the global structured cabling market is projected to reach $15. In this blog, we'll explain how patch panels work, the.
