

Fiber optic cable passing through a well

Overview

Permanent downhole fiber-optic cables are critical infrastructure in wellbore monitoring systems, ensuring reliable transmission of data for applications such as distributed temperature, acoustic, and strain sensing (DTS, DAS, and DSS)—all with one 1/4-in control line. ExpressFiber is run in offset wells to acquire direct measurements of distributed. Aspects of the subject technology relate to systems and methods for deploying fiber optic lines in a wellbore using a fiber optic deployment device. These monitoring systems help. A flexible optical fiber cable, either as a wireline or a disposable fiber deployed using a pumped fiber payout shuttle, in a horizontal well, can be used to measure distributed near-static or dynamic strain. The technology addressed in this course originated for oil and gas operations but are applicable for subsurface CCUS, geothermal.
