

How to use a Multisim spectral analyzer

Overview

In Multisim, the instrument which can measure signals in the frequency domain is called the Spectrum Analyzer. Place it just like you would with any other. Multisim's Spectrum Analyzer does not generate the noise normally expected in a real-world spectrum analyzer. In reality, the noise generated by a spectrum analyzer (due to the random electron motion through the various components of an analyzer) is amplified by the various gain stages in the. As you would expect, Multisim allows users to analyze signals in the frequency domain. There are two ways to do this. 1) Place the spectrum analyzer on the working platform. The operation steps are the same as those of a multimeter: place the mouse on the right border of the work. it applies to radio frequency (RF) communications. One thing that I always find is that, the default settings for vertical range is too large for many real life RF signals.
