

Installation process of optical fiber cable in ducts

Overview

Installing duct fiber requires specialized techniques to navigate ducts (which may have bends, joints, or obstacles). The two most common methods are pulling and air blowing —each with unique advantages and use cases. The pulling method uses mechanical force to pull the cable. Corning Optical Communications cable specification sheets are available which list the maximum tensile load for various cable types. The installation process is influenced by local conditions, local climate, customer's existing procedures, and customer requirements. Pulling has been the first technology for installing OF cables in duct. It. Where reels are supplied with protective material fitted over the cable, the protection should remain in place until the cable will be installed. The cable should be bent as little as possible.
