

Is the optical module a single unit or a pair

Overview

It combines a transmitter and a receiver in a single unit, enabling two-way communication. In practice, most optical modules used in networking are transceivers because they handle bidirectional data flow. Multi-mode modules are good for short distances. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. o In optical modules, "core" refers to the light-transmitting channel in the fiber. A 1-core fiber is like a single-lane road—only one car (or data signal) can travel at a. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa.
