

Remote monitoring power supply system for telecom sites used in data center interconnection

Overview

This research paper presents a comprehensive study on the development of an IoT-enabled remote monitoring system for telecom SMPS (Switched-Mode Power Supply). Our Site Centri series allows you to monitor, log, and control your equipment from anywhere with a computer or smartphone through a standard web page. At DPS Telecom, we've built remote power monitoring equipment used by 1,500+ organizations across telecom, electric utilities, government. Both remote transmission sites and town centre exchange nodes require secure power and monitoring to operate reliably whilst co-location infrastructure needs to be monetised through consumption allocation. Innovation is at the heart of our solutions. We aim to answer your needs at each step of your. Engineers working on maintaining data center infrastructure must monitor power usage closely across the entire power distribution chain—from the power grid to transformers, main distribution board (MDB), and uninterruptible power supply (UPS), as well as to power distribution unit (PDU) and. Discover efficient remote monitoring solutions and management systems that deliver true value for your operations and business.
