

Why is there no copper in optical fiber cables

Overview

Contrary to popular belief, fiber optic cables do not contain copper. Instead, they consist primarily of glass or plastic fibers that transmit data using light signals. These fibers are surrounded by protective coatings made of materials such as polymer or epoxy resin. This guides optical signals via total internal reflection without conductive elements. Eliminating copper delivers significant performance advantages: Immunity to electromagnetic interference (EMI): Light-based signaling prevents. Fiber optic cables and copper wires are the two primary types of cables used in networks. Because data travels as light rather than electricity, there is no inherent need for copper in standard fiber optic cables. Considering this situation, let's take a closer look at the advantages of fiber optic cables.
